Functional Description

The CY62157DV30 is a high-performance CMOS static RAM organized as 512K words by 16 bits. This device features advanced circuit design to provide ultra-low active current.

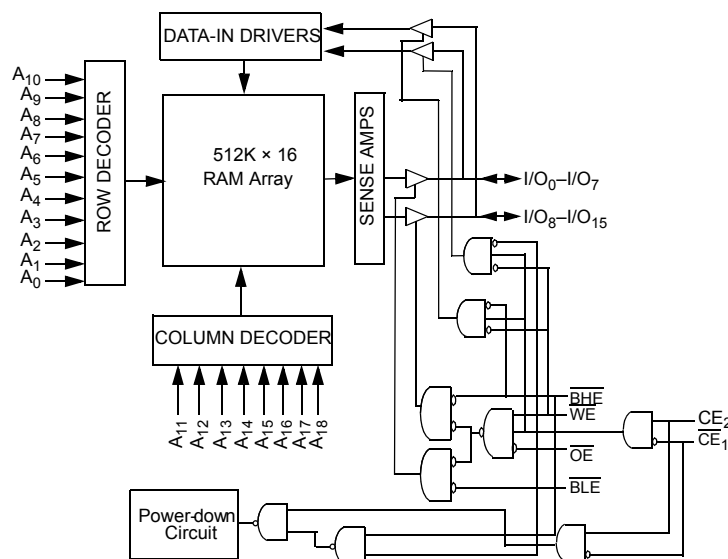

This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power-down feature that significantly reduces power consumption. The device can also be put into standby mode when deselected (\overline{CE}_1 HIGH or CE_2 LOW or both BHE and BLE are HIGH). The input/output pins (I/O₀ through I/O₁₅) are placed in a high-impedance state when: deselected (\overline{CE}_1 HIGH or CE_2 LOW), outputs are disabled (\overline{OE} HIGH), both Byte High Enable and Byte Low Enable are disabled (BHE, BLE HIGH), or during a write operation (CE_1 LOW, CE_2 HIGH and WE LOW).

Writing to the device is accomplished by taking Chip Enables (\overline{CE}_1 LOW and CE_2 HIGH) and Write Enable (WE) input LOW. If Byte Low Enable (BLE) is LOW, then data from I/O pins (I/O₀ through I/O₇), is written into the location specified on the address pins (A₀ through A₁₈). If Byte High Enable (BHE) is LOW, then data from I/O pins (I/O₈ through I/O₁₅) is written into the location specified on the address pins (A₀ through A₁₈).

Reading from the device is accomplished by taking Chip Enables (\overline{CE}_1 LOW and CE_2 HIGH) and Output Enable (\overline{OE}) LOW while forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins will appear on I/O₀ to I/O₇. If Byte High Enable (BHE) is LOW, then data from memory will appear on I/O₈ to I/O₁₅. See the truth table for a complete description of read and write modes.

For best practice recommendations, refer to the Cypress application note [AN1064, SRAM System Guidelines](#).

Notes

15. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns or less, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in the "AC Test Loads and Waveforms" section.
16. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
17. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high-impedance state.
18. The internal Write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} and/or $\overline{BLE} = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the write.

Switching Waveforms

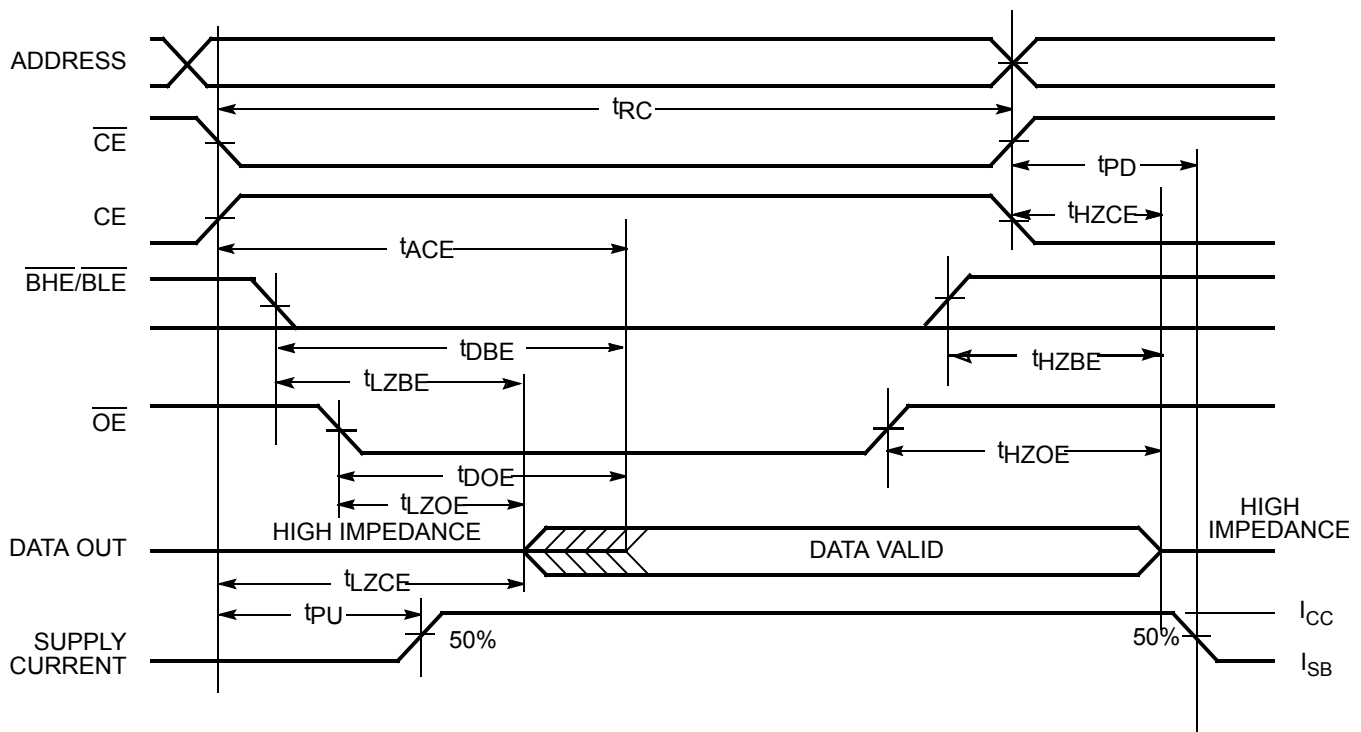

Figure 2. Read Cycle 2 (\overline{OE} Controlled)^[20, 21]

Notes

19. The device is continuously selected. \overline{OE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} and/or $\overline{BLE} = V_{IL}$, and $CE_2 = V_{IH}$.

20. \overline{WE} is HIGH for read cycle.

21. Address valid prior to or coincident with \overline{CE}_1 , \overline{BHE} , \overline{BLE} transition LOW and CE_2 transition HIGH.

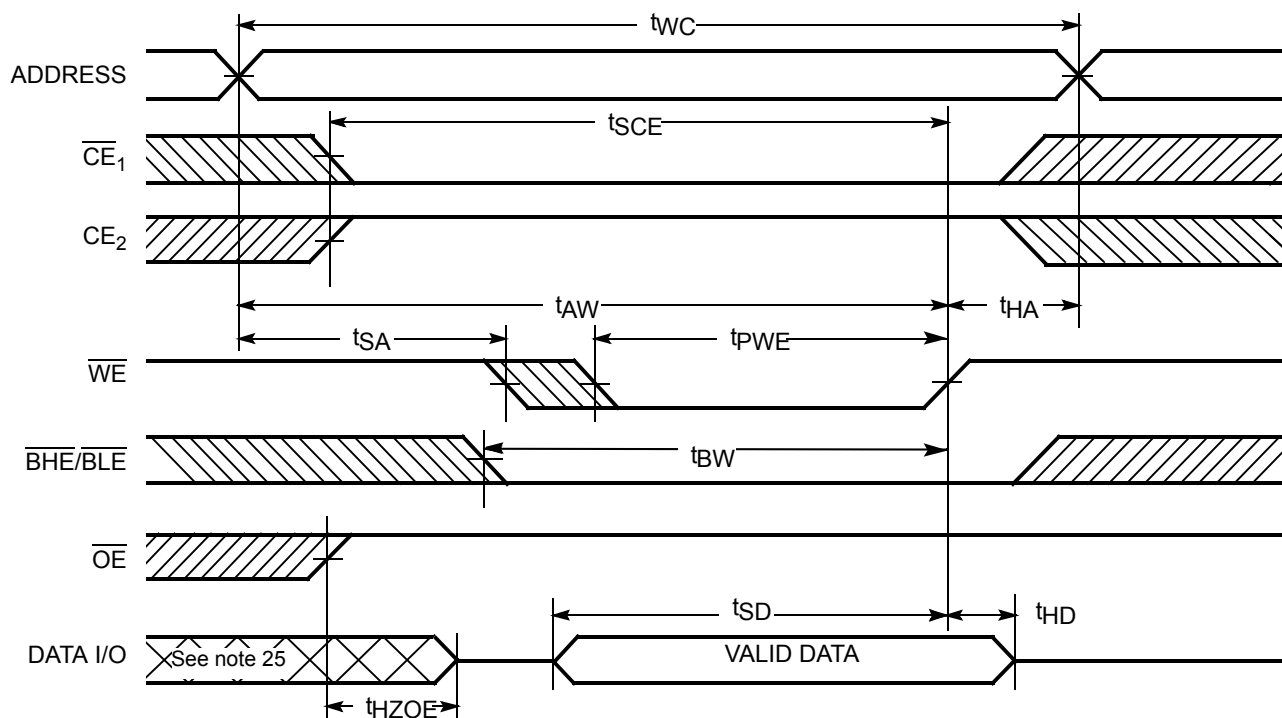

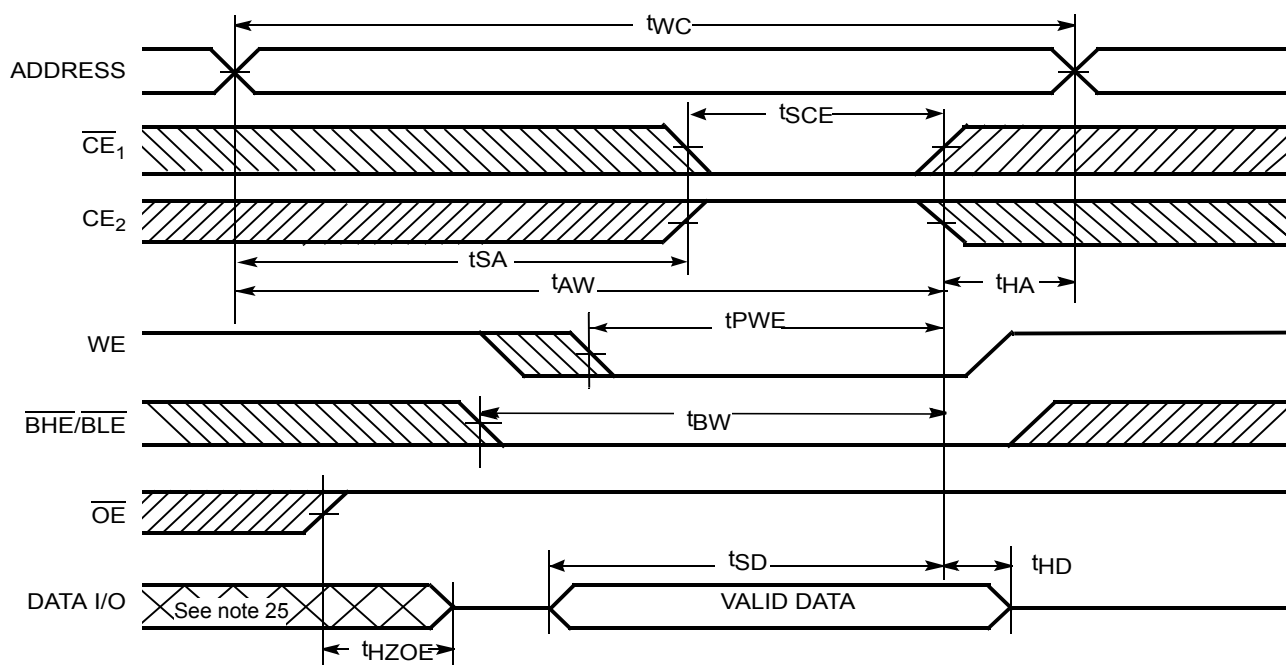

Figure 4. Write Cycle 2 ($\overline{\text{CE}}_1$ or $\overline{\text{CE}}_2$ Controlled)^[22, 23, 24]

Notes

22. The internal Write time of the memory is defined by the overlap of $\overline{\text{WE}}$, $\overline{\text{CE}}_1 = \text{VIL}$, $\overline{\text{BHE}}$ and/or $\overline{\text{BLE}} = \text{VIL}$, and $\overline{\text{CE}}_2 = \text{VIH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the write.
23. Data I/O is high-impedance if $\overline{\text{OE}} = \text{VIH}$.
24. If $\overline{\text{CE}}_1$ goes HIGH and $\overline{\text{CE}}_2$ goes LOW simultaneously with $\overline{\text{WE}} = \text{VIH}$, the output remains in a high-impedance state.
25. During this period, the I/Os are in output state and input signals should not be applied.

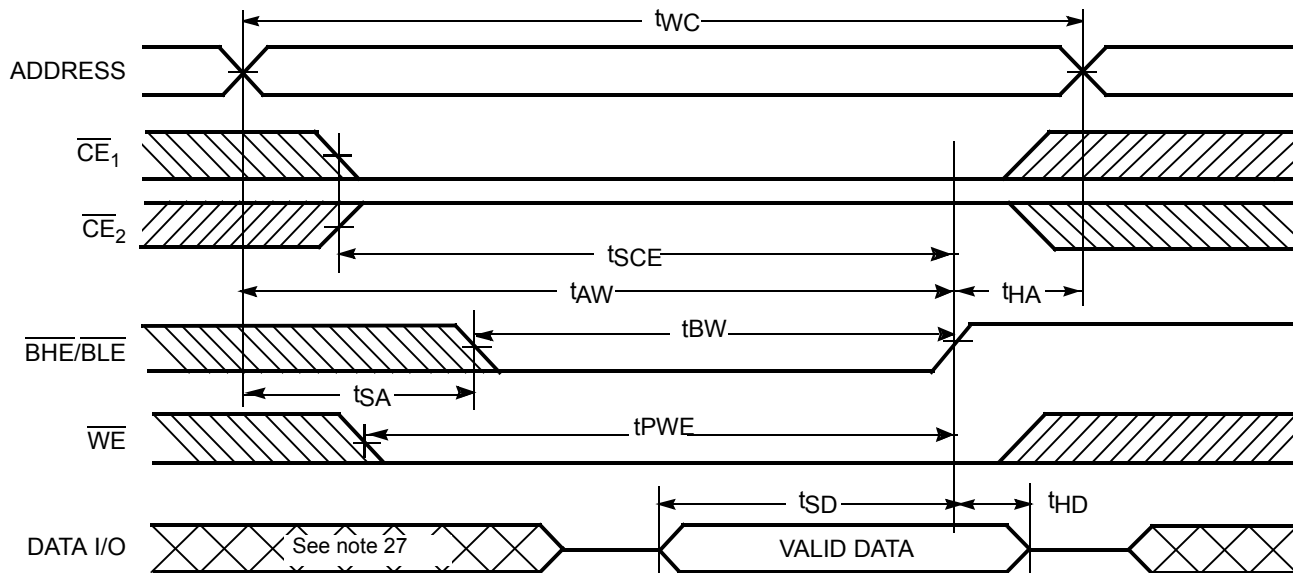

Figure 6. Write Cycle 4 ($\overline{\text{BHE/BLE}}$ Controlled, $\overline{\text{OE}}$ LOW)^[26]

Notes

26. If $\overline{\text{CE}}_1$ goes HIGH and $\overline{\text{CE}}_2$ goes LOW simultaneously with $\overline{\text{WE}} = V_{\text{IH}}$, the output remains in a high-impedance state.
 27. During this period, the I/Os are in output state and input signals should not be applied.
